Effect of magnetic and non-magnetic substitution in topological Kondo insulator SmB6

XIANGFENG WANG, YASUYUKI NAKAJIMA, SHANTA SAHA, JOHNPIERRE PAGLIONE, University of Maryland, College Park, JEFF SONIER, Simon Fraser University, PROF. JOHNPIERRE PAGLIONE TEAM, PROF. JEFF SONIER TEAM — The topological Kondo Insulator SmB6 is believed be the first realization of a topological insulator with true bulk insulating properties that coexist with a robust conducting surface state that mounting evidence suggests is non-trivial. Here we report of a systemic study of the magnetic and non-magnetic doping effect TKI SmB6, in particular the effect of iron inclusion as well as both magnetic and non-magnetic rare earth substitution in Sm1-xRxB6. We will present our careful investigations of crystal structure, transport properties and magnetization, as well as muon spin rotation studies that together suggest a very profound effect on both the bulk and surface state properties.
