### Structural

#### and antiferromagnetic properties of $\text{Ba}(\text{Fe}_{1-x-y}\text{Co}_x\text{Rh}_y)_2\text{As}_2$ compounds<sup>1</sup>

MIN GYU KIM, Lawrence Berkeley National Laboratory, T. W. HEITMANN, The Missouri Research Reactor, S. R. MULCAHY, University of California, Berkeley, E. D. BOURRET-COURCHESNE, Lawrence Berkeley National Laboratory, R. J. BIRGENEAU, University of California, Berkeley — We present a systematic investigation of the electrical, structural, and antiferromagnetic properties for the series of  $\text{Ba}(\text{Fe}_{1-x-y}\text{Co}_x\text{Rh}_y)_2\text{As}_2$  compounds with fixed  $x = 0.027$  and  $0 < y < 0.035$ . We compare our results for the Co-Rh doped  $\text{Ba}(\text{Fe}_{1-x-y}\text{Co}_x\text{Rh}_y)_2\text{As}_2$  compounds with  $\text{Ba}(\text{Fe}_{1-x}\text{Co}_x)_2\text{As}_2$  compounds. We demonstrate that the electrical, structural, antiferromagnetic, and superconducting properties of the Co-Rh doped compounds are similar to the properties of the Co doped compounds. We find that the overall behaviors of  $\text{Ba}(\text{Fe}_{1-x-y}\text{Co}_x\text{Rh}_y)_2\text{As}_2$  and  $\text{Ba}(\text{Fe}_{1-x}\text{Co}_x)_2\text{As}_2$  compounds are very similar when the total number of the extra electrons per Fe/*TM* (*TM* = transition metal) site is considered, which is consistent with the rigid band model. Despite the similarity, we find that the details of the transitions are different in between  $\text{Ba}(\text{Fe}_{1-x-y}\text{Co}_x\text{Rh}_y)_2\text{As}_2$  and  $\text{Ba}(\text{Fe}_{1-x}\text{Co}_x)_2\text{As}_2$  compounds.
