The numerical renormalization group and multi-orbital impurity models

ANDREAS WEICHSELBAUM, K. M. STADLER, J. VON DELFT, Ludwig Maximilians University, Munich, Germany, Z. P. YIN, G. KOTLIAR, Rutgers University, Piscataway, New Jersey, ANDREW MITCHELL, Utrecht University, The Netherlands — The numerical renormalization group (NRG) is a highly versatile and accurate method for the simulation of (effective) fermionic impurity models. Despite that the cost of NRG is exponential in the number of orbitals, by now, symmetric three-band calculations have become available on a routine level. [1] Here we present a recent detailed study on the spin-orbital separation in a three-band Hund metal with relevance for iron-pnictides via the dynamical mean field theory (DMFT). [2] In cases, finally, where the orbital symmetry is broken, we demonstrate that interleaved NRG [3] still offers an accurate alternative approach within the NRG with dramatically improved numerical efficiency at comparable accuracy relative to conventional NRG.
