Specific Heat in High Magnetic Fields of BaFe$_2$(As$_{1-x}$P$_x$)$_2$

CAMILLA M. MOIR, FSU/NHMFL, JOSE A. GALVIS, NHMFL, PHILLIP WALMSLEY, Stanford, JAMES G. ANALYTIS, UC Berkeley, JIUN-HAW CHU, IAN R. FISHER, Stanford, ARKADY SHEKHTER, NHMFL, GREG S. BOE-BINGER, FSU/NHMFL, SCOTT C. RIGGS, NHMFL — We measure the magnetic field dependence of the specific heat in BaFe$_2$(As$_{1-x}$P$_x$)$_2$ with $x$ ranging from $x=0.31$ to $x=0.6$ in fields up to 34.5T. We report three important observations: $\sqrt{H}$ behavior indicating a nodal superconducting gap with a linear energy dispersion, saturation of the heat capacity at the magnetic field that corresponds to the resistive onset [1], and a calculated quasiparticle mass using the increase in the electronic specific heat coefficient when entering the normal state, $\Delta \gamma = \gamma(34.5T) - \gamma(0T)$, as a measure of the normal state specific heat.
