OF PHYSICS ASTRONOMY, CLEMSON UNIVERSITY, CLEMSON, SC 29634 COLLABORATION, LABORATORY OF NANO-BIOPHYSICS AND COMSET, CLEMSON UNIVERSITY, CLEMSON, SC USA 29634 COLLABORATION — A novel chemical-exfoliation spark-plasma-sintering (CE-SPS) process was applied to enhance the thermoelectric figure of merit and compatibility factor of few-layered n-type  $\text{Bi}_2\text{Te}_3$ . New vibrational modes were observed in the micro-Raman spectra of the few-layered  $\text{Bi}_2\text{Te}_3$  samples, which are absent in the bulk. Here we focus on the emergence of the new intermediate and high-frequency Raman modes and their dependence on the layer thickness. A detailed Raman study probing the origin of these exfoliation induced defect modes will be presented.
