Antiperovskite Sr$_3$PbO thin films grown by molecular beam epitaxy

DEBAKANTA SAMAL, HIROYUKI NAKAMURA, HIDENORI TAKAGI, Max Planck Institute for Solid State Research — Several antiperovskite compounds have recently been predicted to host bulk three dimensional Dirac dispersion as well as surface states protected by crystal symmetry. Here, we present fabrication of cubic antiperovskite Sr$_3$PbO films epitaxially grown on LaAlO$_3$ by molecular beam epitaxy. Fabricated films were capped with polymer without breaking vacuum to facilitate ex-situ transport characterization. All of the films showed metallic temperature dependence. The Hall effect measurement suggests that the carrier type is hole, whose density is around $5 \times 10^{19}$ cm$^{-3}$. Details of magnetotransport at low temperature is also described.
