Non-integral-spin bosonic excitations in untextured magnets

AKASHDEEP KAMRA, Department of Physics, University of Konstanz, D-78457 Konstanz, Germany, UTKARSH AGRAWAL, Department of Physics, Indian Institute of Technology Bombay, Powai, Mumbai-400076, India, WOLFGANG BELZIG, Department of Physics, University of Konstanz, D-78457 Konstanz, Germany — Interactions are responsible for intriguing physics, e.g. emergence of exotic ground states and excitations, in a wide range of systems. Here we theoretically demonstrate that dipole-dipole interactions lead to bosonic eigen-excitations with spin ranging from zero to above $\hbar$ in magnets with uniformly magnetized ground states. These exotic excitations can be interpreted as quantum coherent conglomerates of magnons, the eigen-excitations when the dipolar interactions are disregarded. We further find that the eigenmodes in an easy-axis antiferromagnet are spin-zero quasiparticles instead of the widely believed spin $\pm \hbar$ magnons. The latter re-emerge when the symmetry is broken by a sufficiently large applied magnetic field. The spin greater than $\hbar$ is accompanied by vacuum fluctuations and may be considered a weak form of frustration.
