**Magnetic structure and anisotropic spin dynamics in Ba<sub>2</sub>CoO<sub>4</sub>**<sup>1</sup>

QIANG ZHANG, Louisiana State Univ - Baton Rouge, SONGXUE CHI, FENG YE, HUIBO CAO, MASA AKI MATSUDA, Oak Ridge National Laboratory, GUIXIN CAO, RONGYING JIN, WARD PLUMMER, JIANDI ZHANG, Louisiana State Univ - Baton Rouge — Ba<sub>2</sub>CoO<sub>4</sub> crystallizes in a monoclinic structure with Co in the tetrahedral environment, in contrast to the octahedral coordination of Co in BaCoO<sub>3</sub>. Single-crystal neutron diffraction determined an antiferromagnetic ground state with propagation vector (1/2 0 1/2), and Co spins mainly confined in the *ab* plane below  $T_N = 25$  K. The moment is found to be 3.42(4)  $\mu_B$ , pointing to the *a* axis with a canting to *b* axis, indicating a high-spin Co<sup>4+</sup> state in Ba<sub>2</sub>CoO<sub>4</sub>. Inelastic neutron scattering studies show an energy gap  $\approx 2$  meV, and approaches zero as temperature increases to  $T_N$ , which probably results from the single-ion anisotropy of high-spin Co<sup>4+</sup>. The spin wave spectra show distinct dispersion along the *H* and *K* directions without dispersion along the *L* direction in the reciprocal lattice unit, indicating a strong anisotropic spin dynamic behavior. Our findings imply that Ba<sub>2</sub>CoO<sub>4</sub> exhibits a low-dimensional magnetism although the crystalline structure is three dimensional.
