**PT restoration via increased loss and gain in the-symmetric Aubry-André model**<sup>1</sup> CHARLES LIANG, Columbia University, Department of Applied Physics and Applied Mathematics, DEREK SCOTT, YOGESH JOGLEKAR, Indiana University - Purdue University Indianapolis, Department of Physics — In systems with “balanced loss and gain,” the  $PT$  symmetry is broken by increasing the non-Hermiticity or the loss-gain strength. We show that finite lattices with oscillatory,  $PT$  -symmetric potentials exhibit unexpected  $PT$  -symmetry breaking and restoration. We obtain the  $PT$  phase diagram as a function of potential periodicity, which also controls the location complex eigenvalues in the lattice spectrum. We show that the sum of  $PT$  potentials with nearby periodicities leads to  $PT$  -symmetry restoration, where the system goes from a  $PT$  -broken state to a  $PT$  -symmetric state as the average loss-gain strength is increased. We discuss the implications of this transition for the propagation of a light in an array of coupled waveguides. Reference [1] C. H. Liang, D. D. Scott, and Y. N. Joglekar, Phys. Rev.
