Fitting Mock X-ray Observations of Simulated Galaxy Clusters¹

ANDREW PAWL, Naval Academy Preparatory School — We investigate statistically whether fitting the actual X-ray spectrum of a galaxy cluster to a single component, unbroadened X-ray spectrum gives a reliable idea of the temperature and metallicity of the cluster. Eighteen different fitting schemes are performed using Xspec on 198 simulated galaxy clusters and their results compared to the emission-measure weighted temperature and metallicity profiles recovered from the simulations.
