We Detected Phenomena, Like Africa’s Dogon, that Speak of Stellar Gravitational Neutrino Interactions

DAVID MATTHEW MCLEOD, Naturoptics/DECEASED, ROGER DAVID MCLEOD, University Massachusetts Lowell/Naturoptics

Stick figure equivalents of Kokopelli/Pele/Pamola/Thor/Orion/Osiris, Canis Major/Anubis/Wolf/Fox, Leo/Bird Tailed Jaguar/Beaver Tailed Mountain Lion, were detected by us. They figure heavily in the spiritual/scientific world view of many traditional societies, and their cultural respect for the information such figures convey. Scientific instruments from the past were our laboratories, and theirs. All string/stick figure equivalents may represent types of longitudinally aligned neutrino flux between certain stellar pairs. Neutrino beams from distant pulsars, quasars, or other neutrino sources, cannot penetrate these graviton-like strings. They do pass through sectors of Earth, projecting stick figures within instruments like the Watch House at America’s Stonehenge, and perhaps the chamber beneath the Great Pyramid. Sirius B, as the heaviest object in “our” universe for the Dogon, means it shares a profound graviton-like neutrino highway to our sun, as Sirius B/A do within Canis Major. It is possibly projected by a source within the Canis Major dwarf galaxy at about 3,000 times as distant as Sirius B/A at 8.7 ly.

1This paper should be presented fourth.
