Universal Behavior in Frequency- and Temperature- Dependent Hysteresis Loops of Compacted Cobalt-rich Magnetic Nanoparticles¹

K.M. CHOWDARY, The Evergreen State College, Olympia, WA 98505 — We use the polyol process to synthesize cobalt-rich spherical nanoparticles with average particle size 200 nm and average grain size 20 nm that were consolidated via plasma pressure compaction to greater than 90% theoretical full density. Measurements of the minor hysteresis loops of the compacted magnetic nanoparticles over a wide range of frequencies (0.1 to 100 kHz) and temperatures (77° to 873° K) indicate universal behavior in the height, width, and area of the loops. Simulated hysteresis loops determined through numerical solutions of the Néel-Brown thermal after-effect show similar frequency and temperature dependence.
