High Efficiency Collection and Fiber Coupling of Ion Florescence¹

RICHARD GRAHAM, JOHN WRIGHT, ZICHAO ZHOU, TOMASZ SAKREJDA, BORIS BLINOV, University of Washington — Efficient collection of fluorescence light from trapped ions is important for robust qubit state detection and for generating remote entanglement of states. Implementing a modular and scalable ion-trap quantum computer will require a low cost solution for fiber coupling a large fraction of the fluorescence light. We are developing a solution using custom aspheric lenses with a design collection efficiency of 38%.
