Abstract for an Invited Paper  
for the NWS18 Meeting of  
the American Physical Society

**Binary Neutron Star Mergers and Short Gamma-Ray Bursts: the case of GW170817<sup>1</sup>**

DAVIDE LAZZATI, Oregon State Univ

The propagation of a relativistic jet through a static ambient medium drives a bow shock that feeds a cocoon around the jet itself. As the jet breaks out, the cocoon is released, adding a mildly relativistic, wide angle component to the outflow. In this talk I will discuss the dynamics and radiative properties of the ensuing structured jet, considering both radiation from the outflow itself (the so-called prompt emission) and radiation produced by the interaction of the outflow with the interstellar medium (the so-called afterglow). The resulting electromagnetic transients will be discussed as possible interpretations for the observations of GW170817 as well as possible counterparts of future binary merger detections.
