Dipole-Dipole Broadening in $^{85}$Rb Rydberg Samples PAUL TANNER, University of Virginia, B.J. CLAESSENS, Tech. Univ. Eindhoven, WENHUI LI$^1$, T.F. GALLAGHER, University of Virginia — A key interesting property of high-n Rydberg atoms is their large transition dipole moments. These dipole moments allow for observation and manipulation of electric dipole-dipole interactions between Rydberg atoms – a key for quantum computing schemes. We measured the strength of the dipole-dipole interaction vs. Rydberg atom density in a magneto-optical trap – specifically we measured the linewidths of microwave ns-np transitions and observed broadening of up 100 MHz.
