Abstract Submitted for the SES11 Meeting of The American Physical Society

Identifying Electromagnetic Events in the Forward Hadron Calorimeter¹ CHRISTOPHER FRYE, University of Central Florida — The Forward Hadron Calorimeter (HF) of the Compact Muon Solenoid (CMS) at the Large Hadron Collider (LHC) lies in a region not covered by an inner tracking system, and we can rely only on the shapes of showers that hit the HF to determine whether or not they are due to electromagnetic particles. We review the current method of distinguishing shower types in the HF, and we bring attention to a drawback that will become present as the luminosity of the LHC increases and creates a need for tighter shower-shape cuts. We provide a method to correct this drawback, and we analyze the effectiveness of various tight cuts at isolating signal from background.

¹This project was completed in an REU program at the University of Minnesota funded by the NSF.
