Abstract for an Invited Paper  
for the SES14 Meeting of  
the American Physical Society

**T2K**

THOMAS KUTTER, Louisiana State University

The Tokai to Kamioka (T2K) long-baseline neutrino experiment has conclusively demonstrated the appearance of electron neutrinos in a nearly pure beam of muon neutrinos. The T2K experiment also performed the most precise measurements of the neutrino mixing angle  $\theta_{23}$  in the muon neutrino disappearance channel. I will present results from both of these analyses as well as those from a combined  $\nu_e$ -appearance and  $\nu_\mu$ -disappearance analysis. The analysis provides a first hint on the value of the CP phase  $\delta_{CP}$ .
