New Physics Search with Bottomonium Decays at BABAR Experiment¹ ROMULUS GODANG, University of South Alabama, BABAR COLLABORATION — Motivated by the recent astrophysical observations, the searches for the light Higgs boson and dark matter have been performed at the BABAR experiment by studying the radiative decays of the Upsilon(nS) resonances, with $n=1,2,3$ and the multi particle production in e^+e^- annihilation processes. In this presentation I will summarize the stringent limit on the production of a light Higgs boson and the dark matter.

¹The author would like to thank the BABAR Collaboration and the University of South Alabama. This work was supported in part by the U.S. Department of Energy
