3D Simulation Capability for Isentropic Compression Loads¹ S.

CHANTRENNE², T. AO, J.R. ASAY, T.A. HAILL, H.L. HANSHAW, C.A. HALL,
Sandia National Laboratory — For the past 10 years, equation-of-state experiments
have been carried out using magnetic pressure to isentropically compress materials.
Recently, a compact, fast strip-line pulser was designed with the objective of doing
isentropic compression experiments at low cost, with rapid turn around, with good
shot-to-shot reproducibility, and with the ability to shape the current profile for
the material being tested. In this work, we present the results of 3D simulations
of isentropic compression loads that were performed with Sandia National Labora-
tories' ALEGRA MHD code. In order to understand the pressure magnitude and
uniformity, current density distributions were calculated from the capacitors to the
load. Free-surface velocity measurements are compared to those obtained from these
simulations and show reasonable agreement. Details describing the computational
methods used in these simulations will be discussed.

¹Sandia is a multiprogram laboratory operated by Sandia Corporation, a Lockheed
Martin Company, for the U.S. Department of Energy under Contract No. DE-AC04-
94AL85000.
