The American Physical Society

**Shock Induced Phase Transitions in Polymeric Nitrogen**

WILLIAM MATTSON, RADHAKRISHNAN BALU, US Army Research Laboratory — The reported density functional molecular dynamics simulations are of a shock travelling through  $\sim 4,000$  atoms arranged in the equilibrium cg-N configuration equilibrated at  $T = 250\text{K}$ ,  $P = 1\text{ atm}$ . Atoms within a small segment of the material given an extra velocity consistent with various desired flyer plate impact velocity. The resulting atomic trajectories show a number of complex behaviors including a phase transition to a previously unseen phase, spontaneous defect formation, and chemical reactions. The stability of the shock and the unusual properties of the above phenomena will be discussed.
