Searching for anomalous top quark production at the early LHC\textsuperscript{1}

JUN GAO, Southern Methodist University, CHONG SHENG LI, Peking University, LI LIN YANG, University of Zurich, HAO ZHANG, Peking University — We present a detailed study of the anomalous top quark production with subsequent decay at the LHC induced by model-independent flavor-changing neutral-current couplings, incorporating the complete next-to-leading order QCD effects. Our results show that, taking into account the current limits from the Tevatron, the LHC with $\sqrt{s} = 7$ TeV may discover the anomalous coupling at $5\sigma$ level for a very low integrated luminosity of $61 \text{ pb}^{-1}$. The discovery potentials for the anomalous couplings at the LHC are examined in detail. We also discuss the possibility of using the charge ratio to distinguish the $tug$ and $tcg$ couplings.
