

Abstract Submitted
for the TSS07 Meeting of
The American Physical Society

Extending the Measurement of the Anti-Quark Flavor Asymmetry of the Nucleon. RUSTY TOWELL, Abilene Christian University, FNAL E906 COLLABORATION — Fermilab E866/NuSea performed the first measurements of Drell-yan cross section ratio of p+p to p+d collisions over a large kinematic range, allowing the extraction of the ratio of anti-down to anti-up quarks in the proton. After reviewing E866 results, improvements that can be made on these measurements by taking advantage of the Fermilab Main Injector will be discussed. The lower energy of the Main Injector provides a higher Drell-Yan cross section, allowing the extension of all measurements to higher Bjorken-x. E906 is an approved experiment that plans to make these measurements in the near future.
