Neutrino Oscillation Search at MiniBooNE

ERIC D. ZIMMERMAN, University of Colorado

MiniBooNE has searched for $\nu_\mu \rightarrow \nu_e$ oscillations in the high- Δm^2 region suggested by the LSND result. If confirmed to be the result of neutrino oscillations, LSND is not compatible with other oscillation results in a model with only three neutrino masses. In addition, MiniBooNE is sensitive to many neutrino and antineutrino cross-section modes that have not been measured precisely by previous groups. All current results from the experiment will be presented.
