

Abstract for an Invited Paper
for the APR07 Meeting of
The American Physical Society

B Physics at the Tevatron

MATTHEW HERNDON, University of Wisconsin

Due to the large $b\text{-}\bar{b}$ cross section at 1.96 TeV $p\text{-}\bar{p}$ collisions, the Tevatron is currently the largest source of B hadrons. That combined with the 1.5fb^{-1} of integrated luminosity collected and analyzed by the CDF and D0 experiments has led to a bounty of interesting physics results. I will review a selection of the most interesting results produced by the Tevatron in the last year with emphasis placed on the physics B_s meson which is only currently produced in abundance at the Tevatron.
