**Search for Anomalous  $WWZ$  and  $WW\gamma$  Triple Gauge Couplings**

RAMI VANGURI, University of Pennsylvania, CDF COLLABORATION — Limits on  $WW\gamma$  and  $WWZ$  anomalous triple gauge couplings are set using  $WW$  production at the Fermilab Tevatron in  $p\bar{p}$  collisions at  $\sqrt{s} = 1.96$  TeV using the CDF II detector. Fitting the leading lepton  $p_T$  distribution from  $WW \rightarrow l\nu l\nu$  lets us place 95% confidence level limits. Since  $WW$  production can involve a  $Z$  or  $\gamma$  propagator in the s-channel of production, the HISZ parametrization is used to make 3 independent parameters ( $\lambda^Z, \Delta g_1^Z, \Delta\kappa^\gamma$ ). A fit is done to each parameter independently while the other 2 are set to the Standard Model value.
