Measurement of Upsilon Polarization at CDF JAMES THOME,
Carnegie Mellon University, CDF COLLABORATION — The production polariza-
tion for Upsilon(1S), (2S), and (3S) mesons has been measured in dimuon events
from p-pbar collisions at 1.96 TeV, using the CDF detector at the Tevatron. The
measurement is conducted over a pT range of 2-40 GeV/c using data corresponding
to an integrated luminosity of 4.8 fb⁻¹.
