Search for the dark photon in π^0 decays PATRIZIA CENCI, INFN Perugia, Italy, NA48 COLLABORATION — A sample of 17 million fully reconstructed π^0 Dalitz decays produced in charged kaon decays in flight collected by the NA48/2 experiment at CERN in 2003-04 is analysed to search for the dark photon (A') via the decay chain $\pi^0 \rightarrow \gamma A'$, $A' \rightarrow e^+e^-$. No dark photon signal is observed, and the most stringent limits on the dark photon mixing parameter in the mass range 9-70 MeV are established. Limitations of the method and possible future directions are discussed.
