

Abstract Submitted  
for the APR17 Meeting of  
The American Physical Society

**HAWC 1st year catalog** COLAS RIVIRE, University of Maryland, HAWC COLLABORATION — The High Altitude Water Cherenkov (HAWC) Observatory was inaugurated in March 2015. With its high duty cycle and wide field of view, it observes 2/3 of the TeV sky daily. After a single year of observation, the integral sensitivity already exceeds that of the previous generation of wide field instruments by a factor of five. We will present the results of the first all sky search with a year of data of the complete HAWC detector. Some known sources as well as new TeV point and extended sources will be highlighted.
