Portable Atom Chip Vacuum Cell for Rapid BEC Production¹

MATTHEW B. SQUIRES, EVAN A. SALIM, WILLIAM F. HOLMGREN, DANA Z. ANDERSON, Department of Physics and JILA, University of Colorado at Boulder, STERLING E. MCBRIDE, STEVEN A. LIPP, Sarnoff Corporation, JEFFERY F. DENATALE, ROBERT E. MIHAILOVICH, Teledyne Scientific and Imaging, LLC — We have developed a portable BEC system capable of fast loading of atoms onto an atom chip using a double MOT arrangement to spatially separate a high vapor pressure atom source region from an UHV atom cooling and chip region. The atom chip serves as one wall of the vacuum cell and has through-silicon UHV compatible electrical vias, which simplifies connection to on-chip conductors. The cell is constructed using an epoxy-less technique, which permits high bake-out temperature. We have observed that high bake out temperatures leads to excellent vacuum properties, but eliminates the effectiveness of light-assisted atom desorption as a means to modulate rubidium vapor pressure. Instead, fast loading in a 6 beam MOT is obtained by loading from a 2D MOT in a separate high vapor pressure region isolated from the UHV section with a 1 mm aperture. Captured atom flux is as high as 10^9 atoms/sec in the 6-beam MOT.
