Bose polarons in the strongly interacting regime DHRUV KEDAR, MING-GUANG HU, MICHAEL VAN DE GRAAFF, JOHN CORSON, ERIC CORNELL, DEBORAH JIN, University of Colorado, Boulder — Impurities immersed in and interacting with a Bose-Einstein condensate (BEC) are predicted to form quasiparticle excitations called Bose polarons. I will present experimental evidence of Bose polarons in cold atoms obtained using radio-frequency spectroscopy to measure the excitation spectrum of fermionic K-40 impurities interacting with a BEC of Rb-87 atoms. We use an interspecies Feshbach resonance to tune the interactions between the impurities and the bosons, and we take data in the strongly interacting regime.
