**Millimeter-wave spectroscopy of Rydberg states in potassium<sup>1</sup>**

CHARLES CONOVER, HUAN BUI, GABRIEL FOREST, Colby College Department of Physics and Astronomy — We report high-precision measurements of millimeter-wave transitions between Rydberg states in potassium. We make measurements in a magneto-optical trap with a temperature of 1-2 mK and peak atomic density of  $10^9$  atoms/cm<sup>3</sup>. The cold atoms are excited to Rydberg states in steps from  $4s$  to  $5p$  and from  $5p$  to  $ns$  and  $nd$  states using stabilized external-cavity diode lasers at 405 nm and 980 nm. Millimeter-wave transitions are detected by selective field ionization. We null stray electric fields in three dimensions using potentials applied to a set of mutually perpendicular rods surrounding the MOT cloud. The measured frequency intervals are measured to better than a part in  $10^7$  and are then used to determine the quantum defects and absolute energies of the Rydberg states.
