**Systematics of Evaluated Half-Lives of Double-Beta Decay<sup>1</sup>**

BORIS PRITYCHENKO, Brookhaven National Laboratory — A new evaluation of  $2\beta$ -decay half lives and their systematics is presented. These data extend the previous evaluation and include the analysis of all recent measurements. The nuclear matrix elements for  $2\beta$ -decay transitions in 12 nuclei have been extracted. The recommended values are compared with the large-scale shell-model, QRPA calculations, and experimental data. A  $T_{1/2}^{2\nu} \sim 1/E^8$  systematic trend has been observed for recommended  $^{128,130}\text{Te}$  values. This trend indicates similarities for nuclear matrix elements in Te nuclei and was predicted for  $2\beta(2\nu)$ -decay mode. The complete list of results is available online at <http://www.nndc.bnl.gov/bbdecay/>.
