The American Physical Society

Search for the permanent electric dipole moment of ^{129}Xe
NATASHA SACHDEVA, TIMOTHY CHUPP, FEI GONG, University of Michigan, USA, EARL BABCOCK, ZAHIR SALHI, Jülich Centre for Neutron Science, Germany, MARTIN BURGHOFF, ISAAC FAN, WOLFGANG KILLIAN, SILVIA KNAPPE-GRÜNEBERG, ALLARD SCHABEL, FRANK SEIFERT, LUTZ TRAHMS, JENS VOIGT, Physikalisch-Technische Bundesanstalt, Germany, SKYLER DEGENKOLB, Institut Laue-Langevin, France, PETER FIERLINGER, EVA KRÄGELOH, TOBIAS LINS, MICHAEL MARINO, JONAS MEINEL, BENJAMIN NIESSEN, STEFAN STUIBER, WILLIAM TERRANO, Excellence Cluster Universe and Technische Universität München, Germany, FLORIAN KUCHLER, TRIUMF, Canada, JAIDEEP SINGH, Michigan State University and NSCL, USA — CP-violation in Beyond-the-Standard-Model physics, necessary to explain the baryon asymmetry, gives rise to permanent electric dipole moments (EDMs). EDM measurements of the neutron, electron, paramagnetic and diamagnetic atoms constrain CP-violating parameters. The current limit for the ^{129}Xe EDM is $6 \times 10^{-27} e \cdot \text{cm}$ (95% CL). The HeXeEDM experiment at FRM-II (Munich Research Reactor) and BMSR-2 (Berlin Magnetically Shielded Room) uses a stable magnetic field in a magnetically shielded room and ^3He comagnetometer with potential to improve the limit by two orders of magnitude. Polarized ^3He and ^{129}Xe free precession is detected with SQUID magnetometers in the presence of applied electric and magnetic fields. Conclusions from recent measurements will be presented.
