Photoproduction of Λ^* at CLAS UTSAV SHRESTHA, Ohio Univ, KENNETH HICKS, Ohio University, CLAS COLLABORATION — Much is known about the photoproduction of the hyperon resonances $\Lambda(1405)1/2^-$ and $\Lambda(1520)3/2^-$, but little is known about photoproduction to the higher-mass resonances $\Lambda(1670)1/2^-$ and $\Lambda(1690)3/2^-$. Both pairs of resonances are spin-orbit partners and are rated as 4-star (well-known) by the Particle Data Group. In the quark model, the $\Lambda(1405)$ and $\Lambda(1520)$ resonances are assigned to the $SU(3)$ singlet, where the $\Lambda(1670)$ and $\Lambda(1690)$ are assigned to the octet. In this presentation, we will present differential cross sections for these excited Λ states, $\Lambda(1520)$, $\Lambda(1670)$ and $\Lambda(1690)$, using the photoproduction data from the CLAS detector at Jefferson Lab.
