Gravity, ASAP (As Simple As Possible)¹ JERRY WITT, None —

It has come to me, gravity is a single force connecting all things singularly. This paper will be defining gravity is the dimensional singularity not cancelled, just simply spread dimension ally through motion and time. This would make the singularity one of the fundamental spatial dimensions, thus making time a form of motion through quantum means. Time not exactly a solid point in the space time continuum, unless we refer to the singular now in time. Hawking explained all points in the universe are universal center, being gravity bends space/time about itself. All points center would thus make all point connected on a fairly obvious dimensional level. Einstein explaining all points in relative motion. Would mean the universe is in motion around itself. Entropic Derivation of $f=ma$ in circular motion showing a forty percent derivation along with the three obvious dimensions pi clearly shows, and the fraction to be seen which emerges from it's inverse state when multiplied four to show it's dimensional status. Taking into account rotation thrust outward expanding as it's released. Chameleon energy filling gaps through quantum routes, the singularity is the shortest distance to patch relative abnormality. Inverted, and spread, time's quanta share. Bit of shift, but divide by four.

¹I could use some guidance on getting help with funding, but that's why i'm coming to present this idea. Hoping to find a colleague or someone that has been through the review process.
