Abstract for an Invited Paper
for the HAW09 Meeting of
the American Physical Society

Double Beta Decay in SNO+

MARK CHEN, Queen's University

SNO+ is the follow-up experiment to the Sudbury Neutrino Observatory with liquid scintillator replacing the heavy water. The experiment will detect lower energy solar neutrinos, including the pep and CNO solar neutrinos, and geo and reactor antineutrinos. In addition, SNO+ plans to deploy neodymium in the liquid scintillator to conduct a neutrinoless double beta decay search. Status and plans will be presented.
