Abstract for an Invited Paper  
for the HAW14 Meeting of  
the American Physical Society

### **The XYZ Mesons at BESIII**

RYAN MITCHELL, Indiana University

The XYZ mesons in the charmonium sector do not fit within the normal patterns of charm and anti-charm quark bound states; their precise interpretation remains unsettled. In December of 2012, the BESIII Collaboration undertook a new program to study this class of mesons by directly producing the  $Y(4260)$  and  $Y(4360)$  states in electron-positron collisions. Since that time, BESIII has collected the world's largest samples of  $Y(4260)$  and  $Y(4360)$  decays, which has led to a number of new discoveries. I will review the current status of XYZ studies at BESIII.
