**Weak coupling theory of multicomponent superconductors.**<sup>1</sup>

VALENTINA KUZNETSOVA, VICTOR BARZYKIN, University of Tennessee, Knoxville, TN — We consider the pairing state due to the BCS mechanism in substances of cubic, hexagonal, or tetragonal symmetry, where the superconducting parameter is multicomponent, i.e., transforms according to either a 2-dimensional or a 3-dimensional representation of the crystal point group. We show that the superconducting phase always breaks the time-reversal symmetry for singlet multicomponent superconductors. For triplet superconductors, the superconducting order parameter turns out to be always non-magnetic in the cubic group, ferromagnetic in tetragonal, and either ferromagnetic ( $E_{1u}$  representation) or non-magnetic ( $E_{2u}$  representation) in hexagonal group. According to these results, for example, the superconducting phases in both  $\text{Sr}_2\text{RuO}_4$  and  $\text{Na}_x\text{CoO}_2\text{-yH}_2\text{O}$  should be ferromagnetic.
