Abstract for an Invited Paper  
for the MAR06 Meeting of  
the American Physical Society

**Hydrophobicity at small and large length scales**

DAVID CHANDLER, University of California, Berkeley

This lecture is about the statistics of density fluctuations for liquids at thermodynamic states close to liquid-vapor coexistence. Theoretical and simulation results on the length scale dependence of this statistics will be described and used to explain hydrophobic solvation, hydrophobic forces of assembly and kinetics of hydrophobic collapse. Several issues concerning so-called “drying” near extended hydrophobic surfaces will be addressed, and biophysical implications will be discussed.
