Microwave-enhanced decoherence in one-dimensional metal wires

JIAN WEI, SERGEI PEREVERZEV, MICHAEL GERSHENSON, Rutgers University — We report the effect of monochromatic microwave (MW) radiation on the weak localization corrections to the conductivity of quasi-one-dimensional silver wires. Due to the improved electron cooling in the wires, the MW-induced dephasing was observed without a concomitant overheating of electrons over wide ranges of the MW power P_{MW} and frequency f . The observed dependences of the conductivity and MW-induced dephasing rate on P_{MW} and f are in agreement with the theory by Altshuler, Aronov, and Khmelnitsky.¹ Our results suggest that the saturation of dephasing time, often observed at $T \leq 0.1$ K, may be caused by an insufficient screening of the sample from the external microwave noise.
