

Abstract Submitted  
for the MAR06 Meeting of  
The American Physical Society

**Comments on Summary of Condensed Matter Nuclear Science**

XING Z. LI, BIN LIU, QING M. WEI, Department of Physics, Tsinghua University, Beijing, 100084, China., SHU X. ZHENG, DONG X. CAO, Department of Engineering Physics, Tsinghua University, Beijing, 100084, China — Research involving investigations of the production of tritium in electrolytic cells was a topic that was recommended by the Energy Research Advisory Board(ERAB) report of the U. S. Department of Energy (DOE) in November, 1989. Fifteen years later, the evolution of related research has proven that this was an important recommendation. In the talk, a selective resonant tunneling model is used to attempt to explain the initial discoveries of tritium production. Deuterium flux might play a key role for solving the problem of reproducibility. A further investigation is suggested, based on this model.
