Ferropnictides at high magnetic fields: the role of pairing symmetry and impurity scattering¹

ALEX GUREVICH, National High Magnetic Field Laboratory, Florida State University, Tallahassee, FL 32310

An overview of recent results on the effect of impurity scattering and pairing symmetry on the upper critical field $H_{c2}(T)$ and critical temperature of oxypnictides at very high magnetic fields is given. The role of multiband effects and different scattering impurity channels on the observed anomalous temperature dependencies of anisotropic $H_{c2}(T)$ significantly exceeding the BCS paramagnetic limit is addressed.
