**Magneto-Optics in the search for the topological insulating state**

ALEXANDER SCHAFGANS, Department of Physics, University of California, San Diego, ANDREW LAFORGE, Department of Physics, University of California, Santa Cruz, A. TASKIN, YOICHI ANDO, Institute of Scientific and Industrial Research, Osaka University, Ibaraki, Osaka 567-0047, Japan, DIMITRI BASOV, Department of Physics, University of California, San Diego — We present infrared spectroscopic data for the thermoelectric material Bi-Sb at the insulating composition, taken in magnetic field applied both in the Voight and Faraday geometries, in order to gain insight into the recently discovered topological insulating state. We observe a metallic plasma edge that displays significant blue shift at high temperatures. The form of the plasma edge shows broadening suggestive of sample inhomogeneities. The plasma edge is remarkably sensitive to the applied magnetic field, resulting in a complicated spectral lineshape. We compare these results with magneto-optics of the topological insulator  $\text{Bi}_2\text{Se}_3$ .<sup>1</sup>
