**Transparent and Flexible Large-scale Graphene-based Heater**

JUNMO KANG, SKKU Advanced Institute of Nanotechnology (SAINT) and Center of Human Interface Nano Technology (HINT), Sungkyunkwan University, CHANGGU LEE, YOUNG-JIN KIM, JAE-BOONG CHOI, School of Mechanical Engineering, Sungkyunkwan University, BYUNG HEE HONG, Department of Chemistry, Sungkyunkwan University — We report the application of transparent and flexible heater with high optical transmittance and low sheet resistance using graphene films, showing outstanding thermal and electrical properties. The large-scale graphene films were grown on Cu foil by chemical vapor deposition methods, and transferred to transparent substrates by multiple stacking. The wet chemical doping process enhanced the electrical properties, showing a sheet resistance as low as 35 ohm/sq with 88.5 % transmittance. The temperature response usually depends on the dimension and the sheet resistance of the graphene-based heater. We show that a 4x4 cm<sup>2</sup> heater can reach 80 °C within 40 seconds and large-scale (9x9 cm<sup>2</sup>) heater shows uniformly heating performance, which was measured using thermocouple and infra-red camera. These heaters would be very useful for defogging systems and smart windows.
