**Functionalization of exfoliated graphene by grafting aryl groups**

HANG ZHANG, ELENA BEKYAROVA, ZENG ZHAO, WENZHONG BAO, JHAO-WUN HUANG, MIKHAIL ITKIS, SANDIP NIYOGI, XIAOLIU CHI, HUAZHOU WEI, FENGLIN WANG, ROBERT HADDON, CHUN NING LAU — We studied the transport properties of aryl functionalized exfoliated graphene. For the functionalization the graphene devices were immersed in a solution of diazonium salt. The attachment of aryl free radical to the basal carbon atoms changes the hybridization of the graphitic atoms from  $sp^2$  to  $sp^3$  thereby modifying the lattice's electronic structure. We observe that this opens a Coulomb gap at low temperatures and transport measurements indicate a variable range hopping mechanism. In suspended graphene, which allows for functionalization on both sides, we observe a large transport gap.
