**First-principles Theory of Nonlocal Screening in Graphene<sup>1</sup>**

MARK VAN SCHILFGAARDE, Arizona State University, MIKHAIL KATSNELSON, Radboud University Nijmegen — Using the quasiparticle self-consistent *GW* (QSGW) and local-density (LD) approximations, we calculate the  $q$ -dependent static dielectric function, and derive an effective 2D dielectric function corresponding to screening of point charges. In the  $q \rightarrow 0$  limit, the 2D dielectric constant is found to scale approximately as the square root of the macroscopic dielectric function. Its value is  $\simeq 4$ , in agreement with the predictions of Dirac model. At the same time, in contrast with the Dirac model, the dielectric function is strongly dependent on  $q$ . The QSGW approximation is shown to describe QP levels very well, with small systematic errors analogous to bulk *sp* semiconductors. Local-field effects are rather more important in graphene than in bulk semiconductors.
