Graphene/GaN diodes for ultraviolet and visible photodetectors

FANG LIN, SHAOWEN CHEN, JIE MENG, GEOFFREY TSE, XUEWEN FU, FUJUN XU, BO SHEN, ZHIMIN LIAO, DAPENG YU, Peking Univ, NANOLAB TEAM — The Schottky diodes based on graphene/GaN interface are fabricated and demonstrated for the dual-wavelength photodetection of ultraviolet (UV) and green lights. The physical mechanisms of the photoelectric response of the diodes with different light wavelengths are different. For UV illumination, the photo-generated carriers lower the Schottky barrier and increase the photocurrent. For green light illumination, as the photon energy is smaller than the bandgap of GaN, the hot electrons excited in graphene via internal photoemission are responsible for the photoelectric response. Using graphene as a transparent electrode, the diodes show a \sim mS photoresponse, providing an alternative route toward multi-wavelength photodetectors.
