**Deep strong coupling in a circuit QED system (2) - experiment**

<sup>-1</sup> TOMOKO FUSE, FUMIKI YOSHIHARA, National Institute of Information and Communications Technology, Koganei, Tokyo, Japan, SAHEL ASHHAB, Qatar Environment and Energy Research Institute, Hamad Bin Khalifa University, Qatar Foundation, Doha, Qatar, KOUICHI SEMBA, National Institute of Information and Communications Technology, Koganei, Tokyo, Japan — Among a variety of cavity/circuit-QED systems, the superconducting flux qubit is a promising candidate for increasing the coupling strength further because of its huge magnetic moment. Using a flux qubit,  $g/\omega_r = 0.12$  ( $g$ : coupling strength,  $\omega_r$ : bare resonator frequency) has been reported [1]. However,  $g/\omega_r$  is still lower than 1. Here, instead of the widely used coplanar waveguide (CPW) resonators, we use a lumped-element resonator consisting of an inductor (L) and a capacitor (C). While CPW resonators are distributed-element circuits and are therefore restricted by impedance matching constraints, one can freely choose the ratio,  $L/C$ , of a lumped-element resonator. This allows us to design a much smaller inductance and to make the zero-point current fluctuation much larger. Using a flux qubit and a lumped-element resonator, we have achieved  $g/\omega_r$  comparable to or larger than 1, which is the deep strong coupling regime, where a variety of interesting physics is expected [2]. In this presentation, the sample design and spectroscopy data will be shown. [1] T. Niemczyk et al., *nature physics* 6, 772 (2010). [2] S. Ashhab and F. Nori, *PRA* 81, 042311 (2010).
