Electron-phonon interactions in transport properties of WO_3 ¹

WENNIE WANG, YOUNGHO KANG, BURAK HIMMETOGLU, KARTHIK KRISHNASWAMY, Univ of California - Santa Barbara, ANDERSON JANOTTI, University of Delaware, CHRIS G. VAN DE WALLE, Univ of California - Santa Barbara — High doping concentrations can be achieved in tungsten trioxide (WO_3), which has an ABO_3 perovskite structure with an empty A site. Using first-principles calculations, we investigate the role of LO phonon scattering in electron transport. We use density functional theory to calculate electronic structure and vibrational spectra. Various approaches to electron-phonon coupling are investigated, and the role of spin-orbit splitting in the scattering mechanisms is examined. We compare WO_3 to other perovskites and find that the mobility of WO_3 is enhanced due to the absence of an A-site atom and the presence of spin-orbit coupling.
