Nonreciprocal electrical transport phenomena in Rashba system

KEITA HAMAMOTO, TOSHIYA IDEUE, SHOTA KOSHIKAWA, MOTOHIKO EZAWA, University of Tokyo, SUNAO SHIMIZU, YOSHIO KANEKO, RIKEN Center for Emergent Matter Science (CEMS), YOSHINORI TOKURA, NAOTO NAGAOSA, YOSHINORI IWASA, University of Tokyo, RIKEN Center for Emergent Matter Science (CEMS) — Nonreciprocal response is a consequence of the inversion symmetry breaking where lots of physical responses have directivity. This is essentially a non-linear response like a circular dichroism and second harmonic generation in non-linear optics. The electrical resistivity, which is the most fundamental physical property of materials, also shows the nonreciprocity; the resistivity depends on the direction of the current. In this study, we have investigated the nonreciprocal electrical transport in polar semiconductor BiTeBr which has simple Rashba-type band structure. The measured nonreciprocity for this material is quantitatively reproduced by simple model; single relaxation time Boltzmann equation for Rashba Hamiltonian with in-plane Zeeman field. In this presentation, we explain mainly about the theoretical model and the analysis of the nonreciprocal electrical transport.
